My Pet Pal

My database I am going to be using is going to be Postgres SQL. I chose this database due to the fact that my application would use a many to many database form, below I have added the necessary documentation for this reason.

The user table contains the user's email, username, user ID, pet ID, and Account ID. This will be used with a bootstrap to access this information for the UI, As well as being used for a user's login. The pet account table contains all of the relevant information that deals with the pet, as well as an ID that connects the pet to a

user's ID. This table also contains an appointment ID that connects to the pet account table. Finally, the Accounts table allows for an account number and ID that is associated with a user's account.
